a

Early-window coverage

A fixed 12-h window binned at 10 min gives 72 expected slots per animal; mean coverage 100.0%, minimum 100.0%. Every animal contributed every slot. Aggregate figures; the bundle exports no per-animal coverage vector.

b

The complete a-priori model ladder

Point, leave-one-animal-out estimate; bar, 2.5-97.5% across repeated grouped five-fold splits, with its mean as a tick. n = 111 animals. Rows are in registry order, not performance order, and no test compares two models.
