

a**Molecular similarity between spatial proteomic profiles — NOT anatomical connectivity****Neuropil**

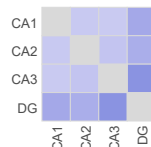

10 spatial units

**Neuronal soma**

4 regions

**Microglia-enriched ROI**

4 regions

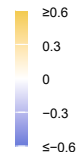

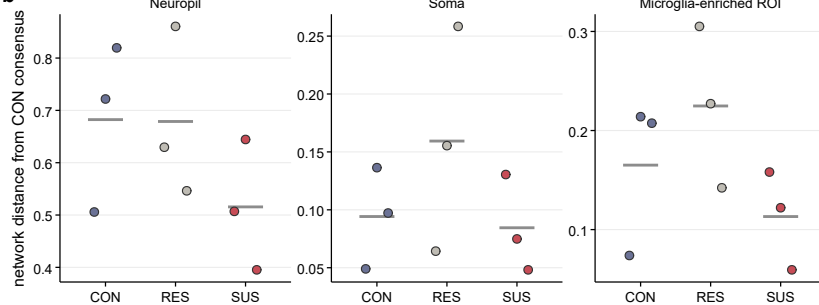

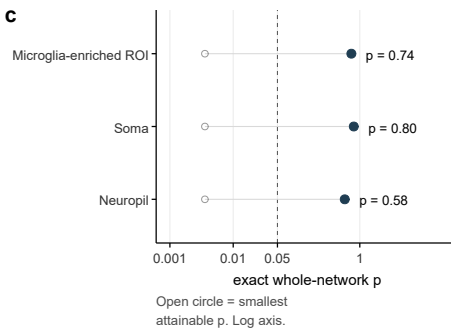

A value is the correlation between two units' protein profiles, not a projection.

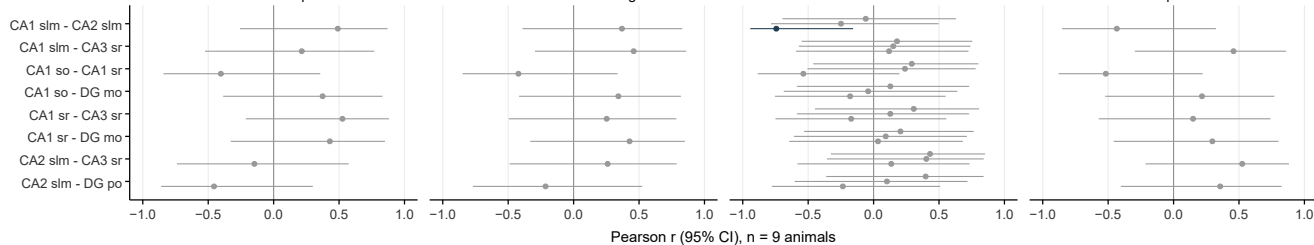

CON animals only ($n = 3$); median across animals; diagonal in grey.

Rows and columns of a block carry the same units in the same order.

One scale centred on zero for all three blocks. Soma and microglia hold no positive value; per-protein centring puts the no-structure reference near $-0.11 / -0.33 / -0.33$.

Median profile correlation (CON)**b****c****d**

48 distinct tests; 1 interval excludes zero; smallest BH = 0.43 within outcome and 0.67 across the family. No edge-behaviour association survived multiple-testing correction.

Pearson r (95% CI), $n = 9$ animals

With $n = 9$ animals a single correlation has very low power; this is a limited-power negative result, not evidence of absence.
